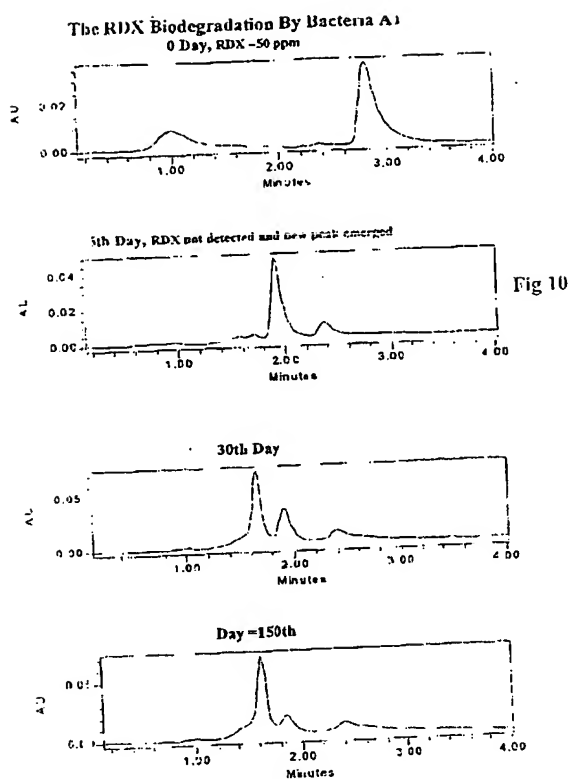

Fig 9

Fig. 11. Bioremediation time course study for RDX degradation by *Rhizobium rhizogenes* (ATCC designated number: PTA-4110) in minimal salt medium with carbon source supplement (glucose: 2 g per liter). All RDX was degraded within 6 days of incubation. Data points represent duplicate cultures.

Fig. 12. The time course of RDX degradation by *Cladosporium cladosporioides* (ATCC 6665) in minimal salt medium with carbon source supplement (glucose 2 g per liter). Total RDX disappeared after 12-week incubation. Data points represent duplicate cultures. Formaldehyde, nitrite and nitrate were also detected in culture media during the course of experiment which indicated complete RDX degradation.
